Chapter 1. VR-Link for Unity SDK

1.1. Introduction	1-3
1.1.1. Build Requirements	1-3
1.1.2. Debugging VR-Link for Unity Plug-ins	1-3
1.2. Architectural Overview	1-4
1.3. GameLink	1-5
1.4. Loading Plug-ins	1-5
1.5. Initializing Connections	1-5
1.6. GameLink Concepts	1-6
1.6.1. Strategies	1-6
1.6.2. Resources	1-7
1.6.3. Delegates	1-7

1.7. Messages	1-8
1.7.1. Message Definition Language	1-8
1.7.2. Message Enums	1-9
1.7.3. Message Structures	1-10
1.7.4. Message Attributes	1-10
1.7.5. Message Configuration	1-11
1.8. The Code Generators	1-11
1.9. Example Plug-in	1-11
1.9.1. Project Description and Setup	1-11
1.9.2. Laser Designator Messages	1-12
1.9.3. Laser Designator Plug-in	1-12
1.9.4. Laser Designator Protocol-Specific Plug-ins	1-12
1.9.5. Laser Designator Strategy	1-13
1.9.6. Unity Changes	1-15

Preface

This guide is a brief introduction to VR-Link for Unity to get you started. For developer documentation, please see the online API documentation.

How this Manual is Organized

The chapters are organized as follows:

Chapter 1, [*VR-Link for Unity SDK*](#), describes the VR-Link for Unity SDK.

MÄK Products

The VR-Link for Unity is a member of the VT MÄK line of software products designed to streamline the process of developing and using networked simulated environments. The VT MÄK product line includes the following:

- ♦ VR-Link® Network Toolkit. VR-Link is an object-oriented library of C++ functions and definitions that implement the High Level Architecture (HLA) and the Distributed Interactive Simulation (DIS) protocol. VR-Link has built-in support for the RPR FOM and allows you to map to other FOMs. This library minimizes the time and effort required to build and maintain new HLA or DIS-compliant applications, and to integrate such compliance into existing applications.

VR-Link includes a set of sample debugging applications and their source code. The source code serves as an example of how to use the VR-Link Toolkit to write applications. The executables provide valuable debugging services such as generating a predictable stream of HLA or DIS messages, and displaying the contents of messages transmitted on the network.

- ♦ **MÄK RTI.** An RTI (Run-Time Infrastructure) is required to run applications using the High Level Architecture (HLA). The MÄK RTI is optimized for high performance. It has an API, RTIsPy®, that allows you to extend the RTI using plug-in modules. It also has a graphical user interface (the RTI Assistant) that helps users with configuration tasks and managing federates and federations.
- ♦ **VR-Forces®.** VR-Forces is a computer generated forces application and toolkit. It provides an application with a GUI, that gives you a 2D and 3D views of a simulated environment.

You can create and view local entities, aggregate them into hierarchical units, assign tasks, set state parameters, and create plans that have tasks, set statements, and conditional statements. VR-Forces also functions as a plan view display for viewing remote entities taking part in an exercise. Using the toolkit, you can extend the VR-Forces application or create your own application for use with another user interface.

- ♦ **VR-Vantage™.** VR-Vantage is a line of products designed to meet your simulation visualization needs. It includes three end-user applications (VR-Vantage Stealth, VR-Vantage PVD, and VR-Vantage IG) and the VR-Vantage Toolkit.
 - VR-Vantage Stealth displays a realistic, 3D view of your virtual world, a 2D plan view, and an exaggerated reality (XR) view. Together these views provide both situational awareness and the big picture of the simulated world. You can move your viewpoint to any location in the 3D world and can attach it to entities so that it moves as they do.
 - VR-Vantage IG is a configurable desktop image generator (IG) for out the window (OTW) scenes and remote camera views. It has most of the features of the Stealth, but is optimized for its IG function.
 - VR-Vantage PVD provides a 2D plan view display. It gives you the big picture of the simulated world.
 - The VR-Vantage Toolkit is a 3D visual application development toolkit. Use it to customize or extend MÄK's VR-Vantage applications, or to integrate VR-Vantage capabilities into your custom applications. VR-Vantage is built on top of OpenSceneGraph (OSG). The toolkit includes the OSG version used to build VR-Vantage.
- ♦ **MÄK Data Logger.** The Data Logger, also called the Logger, can record HLA and DIS exercises and play them back for after-action review. You can play a recorded file at speeds above or below normal and can quickly jump to areas of interest. The Logger has a GUI and a text interface. The Logger API allows you to extend the Logger using plug-in modules or embed the Logger into your own application. The Logger editing features let you merge, trim, and offset Logger recordings.
- ♦ **VR-Exchange™.** VR-Exchange allows simulations that use incompatible communications protocols to interoperate. For example, within the HLA world, using VR-Exchange, federations using the HLA RPR FOM 1.0 can interoperate with simulations using RPR FOM 2.0, or federations using different RTIs can interoperate. VR-Exchange supports HLA, TENA, and DIS translation.

- ♦ VR-TheWorld™ Server. VR-TheWorld Server is a simple, yet powerful, web-based streaming terrain server, developed in conjunction with Pelican Mapping. Delivered with a global base map, you can also easily populate it with your own custom source data through a web-based interface. The server can be deployed on private, classified networks to provide streaming terrain data to a variety of simulation and visualization applications behind your firewall.
- ♦ VR-inTerra. VR-inTerra is a C++ API for adding terrain agility to applications. It can load, page, or stream terrain from a wide variety of formats or sources into a single, consistent run-time representation, consisting of a collision graph and vector network.
- ♦ DI-Guy™. The DI-Guy product line is a set of software tools for real-time human visualization, simulation, and artificial intelligence. Every DI-Guy software offering comes with thousands of ready-to-use characters, appearances, and motions. DI-Guy enables the easy creation of crowds and individuals who are terrain aware, autonomous, and react intelligently to ongoing events. Save time, money and create outstanding simulations with DI-Guy. The DI-Guy product line includes the following products:
 - The DI-Guy SDK. Embed the DI-Guy library in your real-time application and populate your world with lifelike human characters.
 - DI-Guy Scenario™. Author and visualize human performances in a rich, user-friendly graphical environment. Use DI-Guy Scenario as an end visualization application or save scenarios and load them into your DI-Guy SDK enabled application.
 - DI-Guy AI. Generate crowds of autonomous characters to quickly populate your worlds with hundreds and thousands of terrain-aware, collision avoiding DI-Guys. Used as a module on top of DI-Guy Scenario and DI-Guy SDK.
 - Expressive Faces Module. Enable DI-Guy characters to have faces that display emotion, eyes that look in directions and blink, and lips that sync to sound files.
 - DI-Guy Motion Editor. Create or customize motions to your particular needs in an easy-to-use graphical application.

How to Contact Us

For VR-Link for Unity technical support, information about upgrades, and information about other MÄK products, you can contact us in the following ways:

Telephone

Call or fax us at:	Voice:	617-876-8085 (extension 3 for support)
	Fax:	617-876-9208

E-mail

Sales and upgrade information:	info@mak.com
Technical support:	support@mak.com
VR-Vantage support:	vrv-support@mak.com

Post

Send postal correspondence to:	VT MÄK 150 Cambridge Park Drive, 3rd Floor Cambridge, MA, USA 02140
--------------------------------	---

When requesting support, please tell us the product you are using, the version, and the platform on which you are running.

Document Conventions

This manual uses the following typographic conventions:

Monospaced	Indicates commands or values you enter.
Monospaced Bold	Indicates a key on the keyboard.
<i>Monospaced Italic</i>	Indicates command variables that you replace with appropriate values.
Blue text	A hypertext link to another location in this manual or another manual in the documentation set.
{ }	Indicates required arguments.
[]	Indicates optional arguments.
	Separates options in a command where only one option may be chosen at a time.
()	In command syntax, indicates equivalent alternatives for a command-line option, for example, (-h --help).
/	Indicates a directory. Since MÄK products run on both Linux and Windows PC platforms, we use the / (slash) for generic discussions of pathnames. If you are running on a PC, substitute a \ (backslash) when you type pathnames.
<i>Italic</i>	Indicates a file name, pathname, or a class name.
sans Serif	Indicates a parameter or argument.
➤	Indicates a one-step procedure.
Menu → Option	Indicates a menu choice. For example, an instruction to select the Save option from the File menu appears as: Choose File → Save .
	Click the icon to run a tutorial video in the default browser.
	Indicates supplemental or clarifying information.
!	Indicates additional information that you must observe to ensure the success of a procedure or other task.

Directory names are preceded with dot and slash characters that show their position with respect to the VR-Link for Unity home directory. For example, the directory *vr1.2/doc* appears in the text as *./doc*.

Mouse Button Naming Conventions

An instruction to click the mouse button, refers to clicking the primary mouse button, usually the left button for right-handed mice and the right button for left-handed mice. The context-sensitive menu, also called a popup menu or right-click menu, refers to the menu displayed when you click the secondary mouse button, usually the right button on right-handed mice and the left button on left-handed mice.

Third Party Licenses

MÄK software products may use code from third parties. This section contains the license documentation required by these third parties.

Boost License

VR-Link, and all MÄK software that uses VR-Link uses some code that is distributed under the Boost License. All header files that contain Boost code are properly attributed. The Boost web site is: www.boost.org.

Boost Software License - Version 1.0 - August 17th, 2003

Permission is hereby granted, free of charge, to any person or organization obtaining a copy of the software and accompanying documentation covered by this license (the “Software”) to use, reproduce, display, distribute, execute, and transmit the Software, and to prepare derivative works of the Software, and to permit third-parties to whom the Software is furnished to do so, all subject to the following:

The copyright notices in the Software and this entire statement, including the above license grant, this restriction and the following disclaimer, must be included in all copies of the Software, in whole or in part, and all derivative works of the Software, unless such copies or derivative works are solely in the form of machine-executable object code generated by a source language processor.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE AND NON-INFRINGEMENT. IN NO EVENT SHALL THE COPYRIGHT HOLDERS OR ANYONE DISTRIBUTING THE SOFTWARE BE LIABLE FOR ANY DAMAGES OR OTHER LIABILITY, WHETHER IN CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

libXML and libICONV

VR-Link and all MÄK software that uses VR-Link, links in libXML and libICONV. On some platforms the compiled libraries and header files are distributed with MÄK Products. MÄK has made no modifications to these libraries. For more information about these libraries please see the following web sites:

- ♦ The LGPL license is available at: <http://www.gnu.org/licenses/lgpl.html>.
- ♦ Information about IconV is at: <http://www.gnu.org/software/libiconv/>.
- ♦ Information about LibXML is at: <http://xmlsoft.org/>.

Lua

Some MÄK products use the Lua programming language (www.lua.org). Its license is as follows:

Copyright © 1994–2012 Lua.org, PUC-Rio.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

pThreads Library

VR-Exchange links with the pThreads win32 library. The library is distributed under the GNU Lesser General Public License (LGPL). MÄK has made no modification to this library. For information about the pThreads win32 library please see: <http://sourceware.org/pthreads-win32/>

Laser Designator Strategy 1-13

Unity Changes 1-15

1.1. Introduction

This guide explains how to develop plug-ins to extend the behavior of VR-Link for Unity through its C++ SDK. It assumes that you are familiar with distributed networking concepts and VR-Link (the C++ API). This document refers to the example Laser Designator plug-in that is included with the SDK to show how all the concepts covered in this guide are used to extend VR-Link for Unity.

1.1.1. Build Requirements

VR-Link for Unity is built with Microsoft Visual Studio 2010 (VC 10). It uses the 32 bit compiler. It is built against VR-Link 4.0.9d and uses the 32-bit libraries.

1.1.2. Debugging VR-Link for Unity Plug-ins

Since Unity does not release debug versions of its application, you cannot build and run a debug version of VR-Link for Unity. The real issue is that you cannot mix release and debug runtime libraries within an application. However, you can create "release with debug information" DLLs that can be debugged.

1. Create a copy of a release build configuration.
2. Turn on generation of debug symbols.
3. Turn off any optimization.
4. Link to the release runtime libraries in the project settings.

This will allow you to break and step through your plug-ins.

1.2. Architectural Overview

VR-Link for Unity is composed of several layers. Most of the work is done in a C++ library called Game Link, which adds Unity-specific coordinate conversions and entity management logic on top of the VR-Link toolkit. Above the C++ Game Link library is a set of C# bindings called GameLinkCS, which allows the Unity application to access VR-Link and GameLink directly from C#, JavaScript, and so on. GameLinkCS communicates with the underlying C++ libraries through a simple message-passing API.

The GameLinkCS layer is responsible for passing messages between Unity and VR-Link:

- For messages coming from DIS/HLA, GameLinkCS receives messages from VR-Link and stores current state in Unity game object components. It automatically updates transforms to move objects around in the scene, based on VR-Link's dead-reckoning, smoothing, and ground clamping (if necessary). You can extend the built-in message handler to fit the needs of your game design. For events (for example, Fire and Detonate), GameLinkCS provides a mechanism to register callbacks or custom handlers.
- For objects owned by Unity, GameLinkCS provides a "Publish" component which is responsible for passing current state across the language boundary to VR-Link. VR-Link then publishes your objects to the DIS/HLA network. For events and interactions, GameLinkCS provides a C# API to fill out and send the appropriate messages.

1.3. GameLink

The *DtGameLink* class is a singleton class that provides a centralized location to register message decoders, strategies, and resources used during execution. It is automatically created during startup and will load any plug-ins.

1.4. Loading Plug-ins

In order for a VR-Link for Unity plug-in to be loaded, the DLL must be in the plug-ins directory with the distributed VR-Link for Unity DLLs and it must export a function with the following name and signature:

```
extern "C" {  
    DLL_EXPORT bool initGamelinkModule( DtGameLink* gl);  
}
```

1.5. Initializing Connections

VR-Link for Unity is a protocol-agile library. It allows for the protocol-specific strategies to be loaded at runtime based on what the user asked for. Since many strategies may rely upon one another for shared resources, a connection initialization procedure is needed.

In an unconnected state, VR-Link for Unity only has four strategies loaded. These are the protocol-specific initialization strategies. When a connection message is received, the appropriate initialization strategy handles creating the remaining protocol-specific strategies that are responsible for handling objects and interactions. Customer-created strategies need to register themselves with the appropriate initialization strategy during plug-in loading so that they can be executed when a connection is made.

Since the order of initialization is important for dependent strategies, a simple multi-pass initialization step is used to initialize all created strategies during a connection. A number of initialization passes are done to ensure that all strategies are able to create and find any shared resources or other strategies. During each pass, if a strategy is unable to fully initialize due to a missing resource, it tries to initialize in the next pass. This process is repeated until all strategies are initialized or until a deadlock is detected. This initialization step fails if there is a circular dependency.

1.6. GameLink Concepts

This section discusses the GameLink concepts of strategies, resources, and delegates.

1.6.1. Strategies

Strategies are the modular components within GameLink that process object state updates and interactions from VR-Link and create the messages to send to Unity, and vice versa. VR-Link for Unity includes the following strategies:

- ♦ Initialization
- ♦ Entity Object
- ♦ Fire Interaction
- ♦ Detonate Interaction
- ♦ Transmitter Object
- ♦ Signal Interaction
- ♦ Designator Object
- ♦ Data
- ♦ SetData
- ♦ Terrain.

There are copies of each of these strategies for each of the protocols supported by VR-Link (DIS, HLA 1.3, HLA 1516, HLA Evolved). The initialization strategy is responsible for creating the other strategies when a network connection is requested. It is possible to add new types of strategies or replace existing ones with updated behaviors through the use of plug-ins.

Strategies are given some CPU time every frame during a `tick()` function. During this function, any internal work may be done and is typically used to update any entity publishers that the strategy owns.

1.6.2. Resources

During execution certain data structures and classes need to be shared between different strategies. Typically shared resources are reflected objects, the simulation clock, the initialization strategy, and the terrain strategy. Sharing objects between strategies is done by using a resource manager that is accessible from the *DtGameLink* class. The resource manager does not manage the memory of stored objects throughout their lifetime, but does provide a generic means to find and access stored objects and data structures.

There are several default names used for commonly used objects that are defined in *gamelink/utility.h*:

```
GAMELINK_DLL extern const char* EXERCISE_CONNECTION_NAME;
GAMELINK_DLL extern const char* CLOCK_NAME;
GAMELINK_DLL extern const char* REFLECTED_ENTITY_LIST_NAME;
GAMELINK_DLL extern const char* ENTITY_PUBLISHER_LIST_NAME;
GAMELINK_DLL extern const char* TERRAIN_STRATEGY_NAME;
GAMELINK_DLL extern const char* RECEIVER_PUBLISHER_LIST;
GAMELINK_DLL extern const char* REFLECTED_RECEIVER_LIST;
GAMELINK_DLL extern const char* REFLECTED_TRANSMITTER_LIST;
GAMELINK_DLL extern const char* TRANSMITTER_PUBLISHER_LIST;
```

These defined names provide a uniform way to access commonly used objects such as the VR-Link *DtExerciseConnection* or the *DtClock*.

There are also several utility functions to access commonly used objects:

```
GAMELINK_DLL DtExerciseConn* findExConnResource();
GAMELINK_DLL void setExConnResource(DtExerciseConn* conn);
GAMELINK_DLL DtReflectedEntity* findReflectedEntityResource(std::string
    id);
GAMELINK_DLL void setReflectedEntityResource(std::string id,
    DtReflectedEntity* ent);
GAMELINK_DLL DtEntityPublisher* findEntityPublisherResource(std::string
    id);
GAMELINK_DLL void setEntityPublisherResource(std::string id,
    DtEntityPublisher* pub);
GAMELINK_DLL DtClock* findClockResource();
GAMELINK_DLL void setClockResource(DtClock* clock);
GAMELINK_DLL DtReflectedEntityList* findReflectedEntityListResource();
GAMELINK_DLL void setReflectedEntityListResource(DtReflectedEntityList*
    rel);
GAMELINK_DLL DtTerrainStrategy* findTerrainStrategy();
GAMELINK_DLL void setTerrainStrategy(DtTerrainStrategy* ts);
```

1.6.3. Delegates

Delegates are C++ classes that wrap a function to call back at a later time. They are used for message handlers that are registered with GameLink. When a strategy wants notification that a message arrives from Unity, it creates a delegate with one of the strategy's member functions and registers it with the GameLink message handlers.

1.7. Messages

VR-Link communicates with Unity using messages. All messages are serialized into a byte buffer and then sent to Unity through a simple API. Messages are able to serialize and deserialize themselves. To add new messages, you must create a C# implementation and a C++ implementation. This is done by using code generators and a message definition language.

1.7.1. Message Definition Language

The message definition language is written using the Lua language. Messages are declared using the `MESSAGE` keyword, followed by the message layout and configuration in a key:value pair table. The following code is an example of a message:

```
MESSAGE{
  fileName="transmitterState";
  className="TransmitterState";
  includes={};
  dllExport="GAMELINK_DLL";
  enums={
    TransmitState=[{OFF, RADIO_ON_NOT_TRANSMITTING, ON}];
    InputSource=[{OTHER, PILOT, COPILOT, FIRST_OFFICER, DRIVER, LOADER,
GUNNER, COMMANDER, DIGITAL_DATA_DEVICE, INTERCOM}];
    AntennaPatternType=[{OMNIDIRECTIONAL=0, BEAM=1,
SPHERICALHARMONIC=2}];
    CryptoSystem=[{ OTHER, KY_28, VINSON, NSVE, WSVE, SINGARS_ICOM,
KY_75, KY_100}];
    CryptoMode=[{BASEBAND, DIPHASE}];
    ModulationMajorType=[{OTHER, AMPLITUDE,AMPLITUDE_ANGLE, ANGLE=3,
COMBINATION=4, PULSE=5, UNMODULATED=6, CARRIER_PHASE_SHIFT=7}];
    ModulationDetailAplitudeType=[{ OTHER, AFSK, AM, CW, DSB, ISB, LSB,
SSB_FULL, SSB_REDUC, USB, VSB}];
    ModulationDetailAplitudeAngleType=[{ OTHER, APLITUDE_ANGLE}];
    ModulationDetailAngleType=[{ OTHER, FM, FSK, PM}];
    ModulationDetailCombinationType=[{ OTHER, AMPLITUDE_ANGLE_PULSE}];
    ModulationDetailPulseType=[{ OTHER, PULSE, X_BAND, Y_BAND}];
    ModulationDetailUnmodulatedType=[{ OTHER, CONTINUOUS_WAVE}];
    ModulationDetailCarrierPhaseShiftType=[{ OTHER}];
    ModulationSystemType=[{OTHER, GENERIC, HQ, HQII, HQIIA, SINGARS,
CCTT_SINGARS, EPLRS, JTIDS}];
    ReferenceSystem=[{WORLDCOORD=1, ENTITYCOORD=2}];
    StartOfMessage=[{NOT_START, START}];
    ClearChannel=[{NOT_CLEAR, CLEAR}];
    TransmitTerminalPrimaryMode=[{NTR, JTIDS}];
    TransmitTerminalSecondaryMode=[{NONE, NET_POSITION_REFERENCE,
PRIMARY_NAVIGATION_CONTROLLER, SECONDARY_NAVIGATION_CONTROLLER}];
    SyncState=[{COURSE=1, FINE=2}];
  };
  structs={
    ModulationType={
      {type="enum", name="major", enum="ModulationMajorType"};
      {type="UInt16", name="detail"}; --needs to be as the right enum
      {type="enum", name="system", enum="ModulationSystemType"};
    };
    OmniAntennaPattern={}; --this is a null pattern
    BeamAntennaPattern={
```

```

        {type="Vector3", name="orientation"};
        {type="float", name="AzimuthBeamWidth"};
        {type="float", name="ElevationBeamWidth"};
        {type="enum", name="referenceSystem", enum="ReferenceSystem"};
        {type="float", name="EZ"};
        {type="float", name="EX"};
        {type="float", name="phase"};
    };
    SphericalAntennaPattern={
        {type="byte", name="order"};
        {type="List<float>", name="coefficients"};
        {type="enum", name="referenceSystem", enum="ReferenceSystem"};
    };
};
attributes={
    {type="string", name="entityId"};
    {type="UInt16", name="radioId"};
    {type="EntityEnum", name="radioEntityType", new=true};
    {type="enum", name="transmitState", enum="TransmitState"};
    {type="enum", name="inputSource", enum="InputSource"};
    {type="Vector3", name="worldAntennaLocation"};
    {type="Vector3", name="relativeAntennaLocation"};
    {type="enum", name="antennaPatternType", enum="AntennaPatternType"};
    {type="UInt64", name="Frequency"};
    {type="float", name="transmitBandwidth"};
    {type="float", name="power"};
    {type="struct", name="modulationType", struct="ModulationType"};
    {type="enum", name="cryptoMode", enum="CryptoMode"};
    {type="enum", name="cryptoSystem", enum="CryptoSystem"};
    {type="UInt16", name="cryptoKey"};
    {type="List<byte>", name="modulationParameters", new=true};
    {type="List<byte>", name="antennaPatternParameters", new=true};
    {type="bool", name="freqHopInUse"};
    {type="bool", name="pseudoNoiseInUse"};
    {type="bool", name="timeHopInUse"};
}
}

```

Message attributes can be simple data types (listed in [“Message Attributes,”](#) on page 1-10), structures, enumerations, or arrays(lists) of acceptable attribute types.

1.7.2. Message Enums

Message enumerations are defined in the enums table. Enumerations are given a name and then a list of enumerated values within double brackets [[]]. If a specific enumeration should have a specific value, then assign the enum=value in the definition. When declaring a message attribute as an enum, the type is enum and there is an additional field to declare which enum is used, for example:

```
{type="enum", name="transmitState", enum="TransmitState"};
```

1.7.3. Message Structures

Some messages need to package up several datafields into a single structure. These structures can be defined in the structs table. A structure follows the same rules as the attributes table and uses the same data types, which are defined below. When declaring a message attribute as a struct, the type is `struct` and there is an additional field to declare which struct is used, for example:

```
{type="struct", name="modulationType", struct="ModulationType"};
```

1.7.4. Message Attributes

Message attributes define the message layout. Attributes can be defined as a simple data type, an enum, a structure, or a list of any of these types. The simple data types supported are:

- ♦ string
- ♦ bool
- ♦ Int8
- ♦ UInt8
- ♦ Int16
- ♦ UInt16
- ♦ Int32
- ♦ UInt32
- ♦ Int64
- ♦ UInt64
- ♦ float
- ♦ double
- ♦ Vector2
- ♦ Vector3
- ♦ Vector4
- ♦ Quaternion
- ♦ EntityEnum
- ♦ List<DATA TYPE>.

Using an EntityEnum, user defined struct or List<> datatype as an attribute requires that the attribute have the field `new=true` be defined.

```
{type="EntityEnum", name="munitionType", new=true};
```

1.7.5. Message Configuration

The message description has fields for the name of the file to generate (not including the extension) and the name of the class to build. The message definition also contains fields to describe any required include files, or DLL Export macro name, which are only used for the C++ code generator.

1.8. The Code Generators

Once the message definition is written, the included code generators generate C++ and C# source code to encode and decode the message data. Both code generators are command line tools and can be integrated into your build steps to generate message source code as a build step.

The C# code generator has the following command line parameters:

- ♦ `-i` The full path to the message definition file.
- ♦ `-o` The full path to where the generated C# files should go.

The C++ code generator has the following command line parameters:

- ♦ `-i` The full path to the message definition file.
- ♦ `-h` The full path to where the generated C++ header files should go.
- ♦ `-s` The full path to where the generated C++ source file should go.

1.9. Example Plug-in

The included example is the complete source code for a plug-in that adds support for laser designators in DIS and HLA. It uses the C++ VR-Link toolkit and the VR-Link for Unity SDK.

1.9.1. Project Description and Setup

The project files for the example are divided into five projects. One project is for the protocol-independent message representations to be loaded into the message factory. The other protocol projects create plug-ins that load a protocol-specific strategy into the strategy factory and register it with the initialization strategy so that it gets created on connection. Since VR-Link is protocol independent and uses compiler flags to determine which protocol to support, most of the source code for the example is shared among the protocol-specific projects. Changes to files in one project show up as changes in other projects.

Since the project files are configured to use environment variables to find the C++ VR-Link SDK, it is recommended that you edit the included *setupEnvironment.bat* file to match your system and use it to launch Visual Studio.

1.9.2. Laser Designator Messages

Laser designators are stateful objects within DIS and HLA and change their state when painting a target. This means that we need a discovery, state update, and removed message to inform Unity about laser designators.

These messages are defined in *laser.lua*. Entity IDs are transferred to Unity as strings and all positions are vectors in Unity's coordinate system.

1.9.3. Laser Designator Plug-in

The laser designator plug-in loads the laser designator messages into the message factory in its `initGamelinkModule()` function:

```
bool initGamelinkModule( DtGameLink* gl)
{
    // add the message types to the factory so that GameLink knows how to
    // decode them
    gl->messageFactory().registerCreator(
        LaserDesignatorDiscoveryMessage::theMessageName(),
        LaserDesignatorDiscoveryMessage::decode);
    gl->messageFactory().registerCreator(
        LaserDesignatorRemovedMessage::theMessageName(),
        LaserDesignatorRemovedMessage::decode);
    gl->messageFactory().registerCreator(
        LaserDesignatorStateMessage::theMessageName(),
        LaserDesignatorStateMessage::decode);
    return true;
}
```

1.9.4. Laser Designator Protocol-Specific Plug-ins

The protocol-specific laser designator plug-ins load their specific strategy into the strategy factory and register with the initialization strategy to be loaded during connection.

```
bool initGamelinkModule( DtGameLink* gl)
{
    // add the strategies to the factory
    // this is ok to do multiple times since it won't damage anything/or
    // leak resources
    gl->addStrategyCreator(DtLaserDesignatorStrategy::theName(),
        DtLaserDesignatorStrategy::create);

    // add the strategy to the correct init strategy so that it gets
    // created during initialization
    DtInitStrategy* initStr=dynamic_cast<DtInitStrategy*>(
        gl->findStrategy(DtInitStrategy::theName()));
    if(initStr!=NULL)
    {
        initStr->addInitChild(DtLaserDesignatorStrategy::theName());
    }
    else
    {
        DtWarn << "Unable to register Laser strategy with the Initialization
        strategy for DIS protocol" << std::endl;
    }
}
```

```

    }

    return true;
}

```

1.9.5. Laser Designator Strategy

When the laser designator strategy is created it registers interest in laser object messages with GameLink. It does this by wrapping its handler member functions with a delegate and passing this delegate to GameLink:

```

myDesignatorDiscoveredHandler=new DtMessageDelegate(this,
    &DtLaserDesignatorStrategy::handleUnityDesignatorDiscovered);
myDesignatorRemovedHandler=new DtMessageDelegate(this,
    &DtLaserDesignatorStrategy::handleUnityDesignatorRemoved);
myDesignatorStateHandler=new DtMessageDelegate(this,
    &DtLaserDesignatorStrategy::handleUnityDesignatorState);

myGameLink->addHandler(
    LaserDesignatorDiscoveryMessage::theMessageName(),
    myDesignatorDiscoveredHandler);
myGameLink->addHandler(LaserDesignatorRemovedMessage::theMessageName(),
    myDesignatorRemovedHandler);
myGameLink->addHandler(LaserDesignatorStateMessage::theMessageName(),
    myDesignatorStateHandler);

```

It is important to remember to remove these delegates from GameLink during shut-down so that they do not get called after the strategy is destroyed.

```

myGameLink->removeHandler(
    LaserDesignatorDiscoveryMessage::theMessageName(),
    myDesignatorDiscoveredHandler);
myGameLink->removeHandler(
    LaserDesignatorRemovedMessage::theMessageName(),
    myDesignatorRemovedHandler);
myGameLink->removeHandler(
    LaserDesignatorStateMessage::theMessageName(),
    myDesignatorStateHandler);

```

The initialization function of the laser designator strategy:

- ♦ Finds the exercise connection shared resource.
- ♦ Creates a reflected laser designator list .
- ♦ Installs some callbacks on it to listen for laser designators coming from the DIS/HLA network.
- ♦ Creates a laser designator publisher list to hold publishers that it creates to mirror laser designators being controlled in Unity.

```

bool DtLaserDesignatorStrategy::init()
{
    if(myInitalized==true) return true;

    myExconn=findExConnResource();
    if(myExconn!=NULL)
    {
        //get the terrain strategy for coordinate conversions
        myTerrainStrategy=findTerrainStrategy();
    }
}

```

```
if(myTerrainStrategy==NULL)
{
    //not ready yet, try again next pass
    return false;
}

//radio Designators
myRelDx=new DtReflectedDesignatorList(myExconn);
myRelDx->addDesignatorAdditionCallback(
    &DtLaserDesignatorStrategy::vrlDesignatorDiscovered, this);
myRelDx->addDesignatorRemovalCallback(
    &DtLaserDesignatorStrategy::vrlDesignatorRemoved, this);
myGameLink->setResource("REFLECTED_DESIGNATOR_LIST", myRelDx);
myDxPubs=new DtPublisherList<DtDesignatorPublisher>();
myGameLink->setResource("DESIGNATOR_PUBLISHER_LIST", myDxPubs);
myIntialized=true;
DtDebug << "Laser Designator strategy initialized" << std::endl;
}

return myIntialized;
}
```

This initialization function may run multiple times as it tries to get the resources that it needs to fully initialize. If the event cannot get the shared resource exercise connection it may return false, causing it to be run again. When it has all its resources and is able to initialize, it must protect itself against being initialized again by returning true.

During the tick function, which is called every frame, the Laser Designator strategy updates any laser designator publishers that it created to mirror laser designators from Unity to the DIS/HLA network.

```
myDxPubs->tick();
```

The strategy contains several callbacks for registering with VR-Link and with the GameLink message handlers to handle discovery, removal and state update of laser designators from both the DIS/HLA network and within Unity. These callbacks marshall the data to and from the laser designator messages and VR-Link data structures, making sure to convert entity names and terrain coordinates using the conversion routines in the initialization strategy and terrain strategy, respectively.

Convert the Unity name to the VR-Link name:

```
pub->dsrc()->setDesignatedObject(DtInitStrategy::unityToVrlinkId(dxMsg-
    >getTargetId()));
```

Convert the VR-Link position to the the Unity position:

```
DtVector vec=myTerrainStrategy->geocentricToUnityPosition(dx->dsrc()-
    >designatorSpotLocation());
```

1.9.6. Unity Changes

In order to receive and create laser designators within Unity we must modify the simulation manager behavior to know how to handle laser designator messages and create the right type of publishers and reflected laser designators.

```
myMessageHandlers[LaserDesignatorDiscoveryMessage.theName]=new
    MessageDelegate(handleLaserDesignatorDiscoveryMessage);
myMessageHandlers[LaserDesignatorRemovedMessage.theName]=new
    MessageDelegate(handleLaserDesignatorRemovedMessage);
myMessageHandlers[LaserDesignatorStateMessage.theName]=new
    MessageDelegate(handleLaserDesignatorStateMessage);
```

Next we need to implement the functions to handle the messages within the simulation manager. This includes creating a reflected designator behavior when a new designator is discovered from the network, attaching it to the designated entity, and sending the designator state messages to handle. This is done through the following functions.

```
public void handleLaserDesignatorDiscoveryMessage(Message m)
{
    LaserDesignatorDiscoveryMessage tdm=m as
    LaserDesignatorDiscoveryMessage;
    if(tdm!=null)
    {
        //find the game object to attach to
        GameObject instance=GameObject.Find(tdm.entityId);

        if(instance!=null)
        {
            //setup the reflected behavior
            ReflectedDesignatorBehavior
            rb=instance.GetComponentInChildren<ReflectedDesignatorBehavior>();
            if(rb==null)
            {
                rb=instance.AddComponent<ReflectedDesignatorBehavior>();
            }
        }
    }
}

public void handleLaserDesignatorRemovedMessage(Message m)
{
    LaserDesignatorRemovedMessage trm=m as
    LaserDesignatorRemovedMessage;
    if(trm!=null)
    {
        GameObject instance=GameObject.Find(trm.entityId);
        if(instance!=null)
        {
            ReflectedDesignatorBehavior
            rb=instance.GetComponent<ReflectedDesignatorBehavior>();
            Destroy (rb);
        }
    }
}

public void sendLaserDesignatorStateMessage(string id, Message m)
{
    GameObject instance=GameObject.Find(id);
```

```
//update the entity
if(instance!=null)
{
    ReflectedDesignatorBehavior
    rb=instance.GetComponentInChildren<ReflectedDesignatorBehavior>();
    if(rb==null)
    {
        throw new Exception("Error trying to update reflected
transmitter without reflected transmitter behavior component");
    }

    rb.handleMessage(m);
}
else
{
    //discover that entity
    LaserDesignatorStateMessage sm=m as LaserDesignatorStateMessage;
    LaserDesignatorDiscoveryMessage dm=new
LaserDesignatorDiscoveryMessage();
    dm.entityId=sm.entityId;
    handleLaserDesignatorDiscoveryMessage(dm);
}
}

public void handleLaserDesignatorStateMessage(Message m)
{
    LaserDesignatorStateMessage sm=m as LaserDesignatorStateMessage;
    if(sm!=null)
    {
        sendLaserDesignatorStateMessage(sm.entityId, m);
    }
}
```

Once we have the simulation manager modified, we need to ensure that we have a reflected designator behavior and a designator publisher class that we can attach to Unity objects. These classes show a reference implementation of how to handle these messages and objects. It is expected that you would modify them to suit the needs of your application.

The following code (from *DesignatorBehavior.cs*) handles the designator publisher:

```
/*
*****
** Copyright (c) 2013 MAK Technologies, Inc.
** All rights reserved.
*****
*****/

using System;
using UnityEngine;
using System.Collections.Generic;

public class DesignatorPublishBehavior : MonoBehaviour
{
    public float myPower=0.0f;
    public float myWavelength=0.0f;
    public int myCode;
    public Vector3 myWorldSpot=Vector3.zero;
}
```

```

public LaserDesignatorStateMessage myState;

public GameObject SimManager;
protected SimManagerBehavior mySimManager;

// Use this for initialization
void Start ()
{
    if(SimManager==null)
    {
        GameObject[] gos=GameObject.FindGameObjectsWithTag("Simulation");
        foreach(GameObject go in gos)
        {
            SimManagerBehavior sm=go.GetComponent<SimManagerBehavior>();
            if(sm!=null)
            {
                mySimManager=sm;
            }
        }
    }
    else
    {
        SimManagerBehavior
sm=SimManager.GetComponent<SimManagerBehavior>();
        if(sm!=null)
        {
            mySimManager=sm;
        }
    }

    if(mySimManager==null)
    {
        throw new Exception("Unable to find Simualtion Manager Behavior");
    }

    myState=new LaserDesignatorStateMessage();
    myState.entityId=gameObject.GetInstanceID().ToString(); //guaranteed
to be unique

    myState.designatorCode=(LaserDesignatorStateMessage.DesignatorCode)myC
ode;
    myState.power=myPower;
    myState.wavelength=myWavelength;
    myState.worldDesignatorSpot=myWorldSpot;

    //you can update more fields here depending on your simulation
}

void OnDisable()
{
}

// Update is called once per frame
void Update ()
{
    if(mySimManager.connected==true)
    {
        myState.power=myPower;
    }
}

```

```
        myState.wavelength=myWavelength;
        myState.worldDesignatorSpot=myWorldSpot;
        mySimManager.sendGamelinkMessage(myState);
    }
}
}
```

The following code (from *ReflectedDesignatorBehavior.cs*) handles the reflected designator:

```
/*
*****
** Copyright (c) 2013 MAK Technologies, Inc.
** All rights reserved.
*****
*****/

using System;
using UnityEngine;
using System.Collections.Generic;

public class ReflectedDesignatorBehavior : MonoBehaviour
{
    public LaserDesignatorStateMessage myState;

    Dictionary<string, MessageDelegate> myMessageHandlers=new
    Dictionary<string, MessageDelegate>();

    // Use this for initialization
    void Start ()
    {
        myMessageHandlers[LaserDesignatorStateMessage.theName]=new
        MessageDelegate(handleStateMessage);
    }

    // Update is called once per frame
    void Update ()
    {
    }

    public void handleMessage(Message m)
    {
        MessageDelegate md;
        if(myMessageHandlers.TryGetValue(m.name, out md)==true)
        {
            md(m);
        }
    }

    public void handleStateMessage(Message m)
    {
        LaserDesignatorStateMessage sm=m as LaserDesignatorStateMessage;
        if(sm!=null)
        {
            myState=sm;
        }
    }
}
```
